

Bayes' Theorem

600.465 - Intro to NLP - J. Eisner

1

Bayes' Theorem

- $p(A | B) = p(B | A) * p(A) / p(B)$
- Easy to check by removing syntactic sugar
- Use 1: Converts $p(B | A)$ to $p(A | B)$
- Use 2: Updates $p(A)$ to $p(A | B)$
- Stare at it so you'll recognize it later

600.465 - Intro to NLP - J. Eisner

2

Language ID

- Given a sentence x , I suggested comparing its prob in different languages:
 - $p(\text{SENT}=x | \text{LANG}=\text{english})$ (i.e., $p_{\text{english}}(\text{SENT}=x)$)
 - $p(\text{SENT}=x | \text{LANG}=\text{polish})$ (i.e., $p_{\text{polish}}(\text{SENT}=x)$)
 - $p(\text{SENT}=x | \text{LANG}=\text{xhosa})$ (i.e., $p_{\text{xhosa}}(\text{SENT}=x)$)
- But surely for language ID we should compare
 - $p(\text{LANG}=\text{english} | \text{SENT}=x)$
 - $p(\text{LANG}=\text{polish} | \text{SENT}=x)$
 - $p(\text{LANG}=\text{xhosa} | \text{SENT}=x)$

600.465 - Intro to NLP - J. Eisner

3

Language ID

- For language ID we should compare
 - $p(\text{LANG}=\text{english} | \text{SENT}=x)$
 - $p(\text{LANG}=\text{polish} | \text{SENT}=x)$
 - $p(\text{LANG}=\text{xhosa} | \text{SENT}=x)$*a posteriori*
- For ease, multiply by $p(\text{SENT}=x)$ and compare
 - $p(\text{LANG}=\text{english}, \text{SENT}=x)$
 - $p(\text{LANG}=\text{polish}, \text{SENT}=x)$
 - $p(\text{LANG}=\text{xhosa}, \text{SENT}=x)$*sum of these is a way to find $p(\text{SENT}=x)$; can divide back by that to get posterior probs*
- Must know prior probabilities; then rewrite as

$p(\text{LANG}=\text{english})$	$*$	$p(\text{SENT}=x \text{LANG}=\text{english})$
$p(\text{LANG}=\text{polish})$	$*$	$p(\text{SENT}=x \text{LANG}=\text{polish})$
$p(\text{LANG}=\text{xhosa})$	$*$	$p(\text{SENT}=x \text{LANG}=\text{xhosa})$
<i>a priori</i>		<i>likelihood (what we had before)</i>

600.465 - Intro to NLP - J. Eisner

4

General Case ("noisy channel")

600.465 - Intro to NLP - J. Eisner

5

Language ID

- For language ID we should compare
 - $p(\text{LANG}=\text{english} | \text{SENT}=x)$
 - $p(\text{LANG}=\text{polish} | \text{SENT}=x)$
 - $p(\text{LANG}=\text{xhosa} | \text{SENT}=x)$*a posteriori*
- For ease, multiply by $p(\text{SENT}=x)$ and compare
 - $p(\text{LANG}=\text{english}, \text{SENT}=x)$
 - $p(\text{LANG}=\text{polish}, \text{SENT}=x)$
 - $p(\text{LANG}=\text{xhosa}, \text{SENT}=x)$
- Must know prior probabilities; then rewrite as

$p(\text{LANG}=\text{english})$	$*$	$p(\text{SENT}=x \text{LANG}=\text{english})$
$p(\text{LANG}=\text{polish})$	$*$	$p(\text{SENT}=x \text{LANG}=\text{polish})$
$p(\text{LANG}=\text{xhosa})$	$*$	$p(\text{SENT}=x \text{LANG}=\text{xhosa})$
<i>a priori</i>		<i>likelihood</i>

600.465 - Intro to NLP - J. Eisner

6

General Case (“noisy channel”)

- Want most likely A to have generated evidence B
 - $p(A = a1 | B = b)$
 - $p(A = a2 | B = b)$
 - $p(A = a3 | B = b)$*a posteriori*
- For ease, multiply by $p(\text{SOUND}=x)$ and compare
 - $p(A = a1, B = b)$
 - $p(A = a2, B = b)$
 - $p(A = a3, B = b)$
- Must know prior probabilities; then rewrite as

$p(A = a1)$	*	$p(B = b A = a1)$
$p(A = a2)$	*	$p(B = b A = a2)$
$p(A = a3)$	*	$p(B = b A = a3)$

a priori *likelihood*

6.00.465 - Intro to NLP - J. Elinger

7

Speech Recognition

- For baby speech recognition we should compare
 - $p(\text{MEANING}=\text{gimme} | \text{SOUND}=\text{uhh})$
 - $p(\text{MEANING}=\text{changeme} | \text{SOUND}=\text{uhh})$
 - $p(\text{MEANING}=\text{loveme} | \text{SOUND}=\text{uhh})$*a posteriori*
- For ease, multiply by $p(\text{SOUND}=\text{uhh})$ & compare
 - $p(\text{MEANING}=\text{gimme}, \text{SOUND}=\text{uhh})$
 - $p(\text{MEANING}=\text{changeme}, \text{SOUND}=\text{uhh})$
 - $p(\text{MEANING}=\text{loveme}, \text{SOUND}=\text{uhh})$
- Must know prior probabilities; then rewrite as

$p(\text{MEAN}=\text{gimme})$	*	$p(\text{SOUND}=\text{uhh} \text{MEAN}=\text{gimme})$
$p(\text{MEAN}=\text{changeme})$	*	$p(\text{SOUND}=\text{uhh} \text{MEAN}=\text{changeme})$
$p(\text{MEAN}=\text{loveme})$	*	$p(\text{SOUND}=\text{uhh} \text{MEAN}=\text{loveme})$

a priori *likelihood*

6.00.465 - Intro to NLP - J. Elinger

8

Life or Death!

- $p(\text{hoof}) = 0.001$ so $p(\neg\text{hoof}) = 0.999$
- $p(\text{positive test} | \neg\text{hoof}) = 0.05$ “false pos”
- $p(\text{negative test} | \text{hoof}) = x \approx 0$ “false neg”
so $p(\text{positive test} | \text{hoof}) = 1-x \approx 1$
- What is $p(\text{hoof} | \text{positive test})$?
 - don't panic - still very small! $< 1/51$ for any x
